Full Stack: Project Abstract

The Idea for our project is to make a group project organizer. In school, I found organizing information between random groups of people was difficult, and many conversations about due dates and what was done would get lost in a discord server chat. We want to create something that would allow you to make an outline for when a project needs to be completed, full of stages and deadlines, that would allow you to document, save, and share your work with other collaborators. For frontend, it needs to be simply designed with straightforward markings for what something is and when it's due, Backend needs to assign who the collaborators are through accounts (Username/Password with access privileges), with a server storing the project itself, allowing it to be accessed by privilege level the collaborators for that specific project.

Hopefully, the project is broad enough to be used for different purposes as well: Event planning, Collective note-taking, etc.
